Summary

IAM Data Engineer with 4+ YOE building data pipelines, automating infrastructure and enterprise integrations using SailPoint, LDAP, Python, NoSQL, Ansible. Proven track record for data collection across systems with focus on security certificate renewal, log aggregation, KPI metrics. Building reliable systems that save time, cost, chaos.

Technical Skills

Languages – Java , Python, Bash, SQL, JavaScript, C | **Cloud –** AWS, GCP(certified), Azure

Tools – SailPoint, LDAP, AD, Service Now, Ant, Tomcat, Authentication & Authorization (OAuth2, JWT), JSON/XML, REST Microservices, Ansible, Gitlab, Jenkins CI/CD, Docker, Terraform

Monitoring – Logstash, Kibana, Grafana, Splunk, CheckMK (Nagios), CloudWatch

Databases – MongoDB, Elasticsearch, MySQL, Oracle, PostgreSQL, Redshift, Big Query, DB2

Professional Experience

Software Integration Engineer| *Dillard's Store, US* 05/2025 – current

Software Integrations Team, responsible to provide scalable pipelines and Identity provisioning for vendor, service, human-test accounts SailPoint IIQ, Google Admin Console, AD, LDAP, SNow, DB2.

- Architected SailPoint IIQ integration layer managing 60k identities and 40 password resets/min; designed custom connectors, LCM workflows, and provisioning rules enforcing enterprise access governance at scale.
- Enabled custom reporting for organizational visibility (VPN Usage, Admin Locked Account), providing stakeholders with actionable insights into system security and user behavior.
- Led technical onboarding and integration delivery for credit card vendor applications supporting SOX compliance audits.
- Orchestrated end-to-end SailPoint IIQ upgrades (v8.3 to v8.4p2) using GitLab and integrating SSB, ensuring environment stability and mitigation of critical security vulnerabilities.
- Enabled $400k cost-savings initiative by automating user restructuring to lower cost tiers saving Google Workspace license; improved DB2 transformation pipeline.
- Restored critical enterprise workflows in SailPoint (Lazy Init Exception) and Google Admin (OAuth Token invalid after compliance reset) applying systemic root cause analysis using Splunk and resolved through code changes and configuration.
- Optimized Jira licensing costs eliminating redundant ticketing; engineered a real-time system of record sync between ServiceNow tickets and GitLab issues. Developed custom REST APIs for issue webhook handlers with secure OAuth integration, enabling 200+ incident updates monthly.

Research Analyst| *UALR, US* 04/2023 – 01/2025

Built and maintained integration pipelines connecting third-party API sources to internal research data infrastructure; designed scalable ingestion flows on GCP/Kubernetes with observability, access governance, and data quality controls.

- Engineered ETL Python pipelines streamlining 80% of manual data collection processes, integrating 3rd party API/DB sources like YouTube, Instagram, TikTok, Reddit using scalable FastAPI endpoints saving 2 months across 4 use-cases.
- Partnered with cross functional teams to centralize Kubernetes pod logs into Elasticsearch using sidecar container, reducing monitoring issues by 40% and faster alerts on Slack.
- Automated cluster and Role Based (RBAC) provisioning process for highly available MongoDB cluster; to handle large social datasets with sharding, auto failover (PSA). Failure metrics gathered in Prometheus and Grafana.
- Improved query performance by 30% migrating 10M+ data points from MySQL to MongoDB and improved indexing.

Data-Reliability Consultant| *Brillio – McDonalds, US* 06/2022 – 11/2022

Leading efforts to improve Error Budgeting for McD processing Infrastructure to reduce data transformation failures.

- Enhanced error observability platform using Elasticsearch and Grafana, to reduce recurring failures across 5 AWS regions and 3

products, by eliminating Prometheus custom exporters.

- Accelerated onboarding applications on cloud reducing time from 60 days to 20 days enabling McDonald's onboard 70% components.
- Analyzed diverse data formats (JSON, CSV, parquet, PSV) across AWS services (S3, EMR, Lambda) and Talend to construct scalable, reusable, real-time pipelines *extracting metrics and KPI*s. Mapped business metrics to KPIs using standard data model.
- Built drill-down dashboards in Grafana reporting in-depth application errors helping to identify repeated flaws ensuring SLA/SLO/SLI threshold compliance. Awarded Brillian of the Month for initiative driven project execution.

Systems Engineer | *TCS - British Telecom* 02/2021 – 06/2022

Part of BT Consumer, responsible for automating, monitoring and critical observability stacks for consumer faced web-apps.

- Led a rapid Elasticsearch *upgrade* in response to the Log4j vulnerability using GitLab CI/CD, Ansible, and bash scripts, achieving secure, zero-downtime *rolling updates*.
- Optimized ETL pipeline performance by 20%, through fine-tuning workers and batch parameters to handle increasing load of 500GB/day logs saving $100k across growing business units. Leveraged JMeter and APIs to load test on performance metrics.
- Automated Certificate Renewal processes using ansible playbook, bash, Rundeck; using industry secure practices with vault and enabling passwordless ssh policy through service accounts.
- Developed Grafana observability dashboards using ELK stack to *automate* daily health checks, achieving a 25% reduction in downtime incidents. Configured *email alerts* to proactively address infrastructure issues.
- Created automated policies transitioning data between different hot/warm tiers and managing snapshot lifecycle for integrity.
- Improved failure handling mechanisms using dead letter queue and grok patterns.

Education

- **Master's of Science, Information Sciences** | University of Arkansas, USA
